How much social competence does the reflective-practitioner need? Motivating teacher students to perceive pupils' and parents' perspective

Anne Levin, University of Bremen, levin@uni-bremen.de Katja Meyer-Siever, University of Bremen, siever@uni-bremen.de

➡ distanced view of action and thinking

Consequences for teacher-education

- → Conceptualization of teachers as reflective practitioners (Schön 1983)
- \rightarrow Reflection-in-action does not work for teacher students

- → Competence of reflection is not natural given (Etscheidt et al. 2012)
- → Training and acquisition in teachers' initial education (Häcker 2017)

Challenges in developing teacher students' competence of reflection

- The frequent use of the request "please reflect" leads to a mental fatigue (Košinár 2017)
- Using obligatory reflection in teacher education increases the social desirability and leads to feigned reflections (Häcker, 2017)
- Teacher-students reflection is highly self-centered and primarily related to their own pedagogical concerns (Wyss 2013)

STORIES

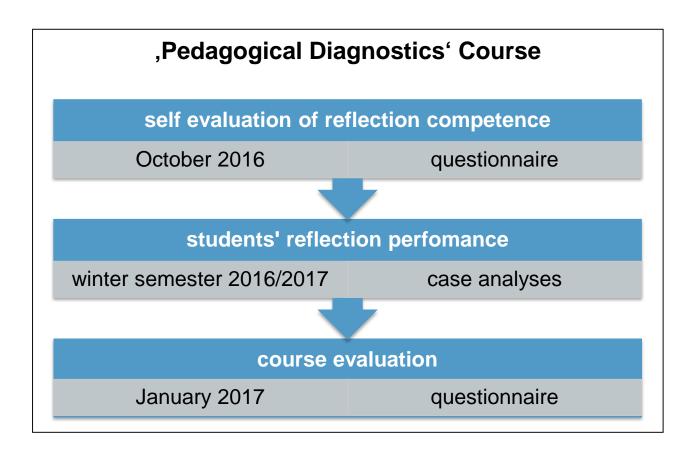

Students' Training Of Reflection In Educational Settings

Reflection Competence							
Linking theory and practice	Perception of different perspectives	Development of alternatives	Reference to one's own professionalization				
What is the central issue? Do I know theoretical models or empirical findings to explain the situation?	How is the situation experienced from different perspectives? How could the behavior of the participants change in the future?	What alternative action of the protagonist and other participants is possible? What changes and supports are needed in relation to other systemic contexts?	What does this mean for me and my professional development? What individual strengths and development tasks can I indicate?				

Impulse for reflection / described by the person involved or described by others (e.g. by the tutor who presents realistic school situations with pedagogical interactions)

Sample: 178 teacher students in the first semester of their master's degree/secondary schools (∅ 24 years of age, ♀ 73%, ♂ 27%)

Research Design: written case analyses

Data collection: Content Analysis

- development of a category system to collect data from teacher students' written drafts
- Convertation to quantitative data by content analysis method
- Deductive approach
- Each main category is subdivided into further subcategories with increasing depth of reflection (e.g. description, explicit naming, case-related explanation and beyond the case, evaluation of different possibilities)

Results: descriptive results, factor analysis - self-assessed

Factors	Cronbach's	Item example	Descriptive Results (n=149)				
(number of items) α			М	SD			
Questionnaire for self-assessment , reflection competence							
Self reflection (7)	.77	I often think about how I can do something better.	2.3*	.6			
Perspective taking (6)	.77	After a conflict I try to understand why the others responded this way.	2.2*	.5			
Questionnaire for seminar evaluation (working on the vignettes by applying STORIES)							
Importance for professionalization (4)	.83	A reflected manner of dealing with my future students is of vital importance for my profession as a teacher.	2.0*	.6			
Willingness to make an effort due to extrinsic motivation (2)	.76	I did the case analyses only to get credit points.	1.9*	.9			

*scores from $1-5 \rightarrow$ lower scores indicate more of it

Results: bivariate correlation analysis (Pearson) of self-assessment & measured reflection competence – vignette 1

	Dimension 1 (linking theory and praxis)	Dimension 2 (perception of different perspectives)	Dimension 3.1 (development of alternatives)	Dimension 3.2 (consideration of other contexts)	Dimension 4 (reference to one's own profes- sionalization)

Universität Bremen*

Students' self-assessed competence of reflection does not go along with the performed issue (almost) at all.

• social desirability leads to overestimation

Need of diagnostic instrument to standardize and simplify feedback to teacher students regarding their reflection competence.

• reflection triggers are not self-experienced

Students have to be able to describe self-experienced situations completely and to write it down adequate.

*EXZELLENT.

They have to realize that they can benefit from other experiences.

Students' self-assessed competence of reflection does not go along with the performed issue (almost) at all.

• Depends on personality traits

 \rightarrow conceptualization of the reflective practitioner and the associated demands needs to be reconsidered

- Depends on cognitive capabilities
 - \rightarrow "Learn from the best"
 - How do students with high cognitive capabilities reflect?
 - How do they proceed?

Deriving alternatives of instructions and guidance to initiate reflection processes.

→ Crucial cognitive capabilities such as attention: ability to solve simple problems under time pressure

What about the correlations between the second dimension (perception of different perspectives) and the

- self-assessed importance for ones' own professionalization (r = .40, p = <01), as well as
- the willingness to make an effort due to extrinsic motivation (r = -.30, p = <05)?

Thank you very much for your attention!
